This memorandum has been prepared by Linscott, Law & Greenspan, Engineers (LLG) to summarize the supplemental transportation assessment prepared for the proposed 15101 Paramount Boulevard Project (“proposed project”) located in City of Paramount, California. LLG previously prepared the transportation assessment dated September 19, 2023 for a prior project development program. The findings of the transportation assessment were confirmed by City of Paramount staff on October 11, 2023. This memorandum has been prepared to provide an updated VMT assessment and intersection operational analysis for the Project.

Description of Modified Project

The project site is located at 15101 Paramount Boulevard. The modified project consists of the development of a 23,256 square-foot grocery store (Building 1), a 3,200 square-foot Panera Bread restaurant with drive through service lane (Building 2 - Tenant A), a 2,048 square-foot fast-food restaurant (Building 2 - Tenant B), and a 2,400 square-foot coffee shop with drive-through service lane (Building 3). The modified Project site plan is shown in **Figure 1**. A comparison of the project components and their corresponding sizes between the prior project and the modified project are shown below:

Land Use	Prior Project	Modified Project
Supermarket	23,256 SF	23,256 SF
Fast-Food Restaurant with Drive-Through Window	2,760 SF	3,200 SF
Fast-Food Restaurant without Drive-Through Window	0 SF	2,048 SF
Coffee Shop with Drive-Through Window	2,400 SF	2,400 SF
TOTAL	28,416 SF	30,904 SF

As shown above, the modified project would result in an overall increase of 2,488 square feet of commercial space when compared to the prior project analyzed in the transportation assessment. The site access and circulation scheme for the Project remains the same as previously proposed.

Updated Project Trip Generation

The updated trip generation forecast for the modified project is summarized in **Table 1**. As shown in *Table 1*, the modified project is forecast to generate a net increase of 468 vehicle trips (247 inbound trips and 221 outbound trips) during the AM peak hour and a net increase of 425 vehicle trips (217 inbound trips and 208 outbound trips) during the PM peak hour. Over a 24-hour period, the proposed project is forecast to generate a net increase of 5,495 daily trip ends during a typical weekday.

When compared with the trip generation forecast for the prior project analyzed in the approved September 19, 2023 transportation assessment, it is concluded that the trip generation forecast for the modified project description results in an increase in traffic volumes for the AM and PM peak hours and on a daily basis. The approved project was forecast to generate a net increase of 360 vehicle trips during the AM peak hour, a net increase of 342 vehicle trips during the PM peak hour, and a net increase of 4,366 vehicle trip ends during a typical weekday. As such, the trip generation forecast for the modified project reflects an increase of 108 vehicle trips during the AM peak hour, 83 vehicle trips during the PM peak hour, and 1,129 vehicle trips on a daily basis when compared to the approved project. For comparison purposes, a copy of the trip generation forecast for the prior project is attached (Table 2-3 from the September 19, 2023 transportation assessment).

Updated Vehicle Miles Traveled (VMT) Assessment

It is understood that the City of Paramount has not formally adopted VMT methodology, screening criteria, or thresholds for VMT analysis of land use development projects within its jurisdiction. It is further understood that the City intends to generally follow the methodology set forth in the Los Angeles County Public Works Transportation Impact Guidelines (dated July 23, 2020).

Consistent with the recommendations provided by the State of California Governor's Office of Planning and Research (OPR) in the *Technical Advisory*, the County's Guidelines recognize the following four (4) types of screening criteria which may be applied to screen proposed projects out of detailed VMT analysis:

- Non-Retail Project Trip Generation Screening Criteria
- Retail Project Site Plan Screening Criteria
- Proximity to Transit Screening Criteria
- Residential Land Use Screening Criteria

Proposed projects are not required to satisfy all of the screening criteria in order to screen out of further VMT analysis; satisfaction of one criterion is sufficient for screening purposes. Projects, or project components, which are screened out of detailed VMT assessment based on these criteria are presumed to have less than significant transportation impacts.

Based on a review of the project's development program, size, and other pertinent factors, it was determined that the County's screening criteria may be applied to the proposed project. Specifically, the "Retail Project Site Plan" screening criterion is applicable to the proposed project. The proposed/modified project consists of the development of a total of 30,904 square-feet of building area (i.e., 23,256 SF supermarket + 3,200 SF fast-food restaurant with drive-through + 2,048 SF fast-food restaurant without drive-through + 2,400 SF coffee shop with drive-through = 30,904 SF). The proposed land use type is identified by County Guidelines as a retail land use, and the size of the overall project is well below 50,000 square feet. Therefore, according to the County's Guidelines, as the proposed project is local serving in nature and is less than 50,000 square feet, the answer to the screening question is "No" and the proposed project satisfies the criteria to be considered a local serving use. Therefore, the project meets the condition to presume less than significant transportation impacts stated in CEQA Guidelines Section 15064.3 and therefore screens out of further VMT analysis.

Updated Intersection Operational Analysis

The four study intersections evaluated in the prior transportation assessment were re-evaluated as part of the supplemental transportation assessment. Four intersections, including the proposed project driveway, were reviewed for consistency with the City of Paramount's adopted Level of Service (LOS) standards. The study intersections were evaluated using the City-approved Highway Capacity Manual (HCM) methodology to determine the LOS under existing and future year 2025 cumulative without and with project conditions.

The relative impact of the added project traffic volumes to be generated by the proposed project during the AM and PM peak hours was evaluated based on analysis of existing and future operating conditions at the study intersections, without and with the proposed project. The previously discussed capacity analysis procedures were utilized to evaluate the delay and service level characteristics at each study intersection. The calculation data worksheets for the analyzed intersections are provided in the attached appendix.

The weekday AM and PM peak hour LOS analysis prepared for the study intersections is summarized in **Table 2**. Based on application of the City's threshold criteria, project-related effects in the delay at the Colorado Avenue/Somerset Boulevard is forecast to exceed the City's threshold criteria. An improvement measure is proposed at the Colorado Avenue/Somerset Boulevard intersection in an effort to reduce the identified forecast project-related effects during the weekday AM and PM peak hours.

The summary of the updated operational analysis of the site driveway is provided in **Table 3**. As presented in **Table 3**, it is concluded the proposed project weekday AM and PM peak hour traffic volumes will not cause or substantially extend vehicle queuing at the site driveway. It should be noted that these results are consistent with the previously reported conclusions contained in the prior transportation assessment.

Summary

Through satisfaction of one of the screening criteria (i.e., the Retail Project Site Plan Screening Criteria), the proposed project meets the condition to presume less than significant transportation impacts stated in CEQA Guidelines Section 15064.3 and is therefore not required to conduct any additional VMT analysis.

Based on application of the City's threshold criteria, project-related effects in the delay at the Colorado Avenue/Somerset Boulevard is forecast to exceed the City's threshold criteria. An improvement measure is proposed at the Colorado Avenue/Somerset Boulevard intersection in an effort to reduce the identified forecast project-related effects during the weekday AM and PM peak hours. In addition, the proposed project weekday AM and PM peak hour traffic volumes will not cause or substantially extend vehicle queuing at the site driveway. The results are consistent with the previously reported conclusions contained in the prior transportation assessment. Thus, the overall results and conclusions of the prior transportation assessment remain valid.

Please feel free to contact us should you have any questions or comments regarding this supplemental transportation assessment.

[a] Intersection analysis based on the Highway Capacity Manual, 6th Edition operational analysis methodologies.

[b] Reported control delay values in seconds per vehicle. For two-way stop controlled intersections, the reported control delay values represent the delays associated with the most constrained movement of the intersection.

[c] Intersection Levels of Service are based on the following criteria:

Signalized Intersection Control Delay (s/veh)	Unsignalized Intersection Control Delay (s/veh)	LOS
<= 10	<= 10	A
> 10-20	> 10-15	B
> 20-35	> 15-25	C
> 35-55	> 25-35	D
> 55-80	> 35-50	E
> 80	> 50	F

Table 3
SUMMARY OF VEHICLE QUEUING [1]
WEEKDAY AM AND PM PEAK HOURS

NO.	DRIVEWAY	TRAFFIC CONTROL	MOVEMENT	PEAK HOUR	95th PERCENTILE QUEUES (FEET PER LANE) [2]					
					EXISTING	EXISTING WITH PROJECT	CHANGE IN QUEUE [3]	YEAR 2025 FUTURE W/O PROJECT	YEAR 2025 FUTURE W/ PROJECT	CHANGE IN QUEUE [3]
1	Project Driveway/ Paramount Boulevard	Unsignalized	EBR	AM	0	5	5	0	5	5
				PM	0	5	5	0	5	5
			SBR	AM	0	0	0	0	0	0
				PM	0	0	0	0	0	0

- [1] Pursuant to LA County Public Works' *Transportation Impact Analysis Guidelines*, July 2020, the Highway Capacity Manual (HCM) methodology for intersections was utilized to calculate vehicle queuing.
- [2] The 95th percentile queue is the maximum back of queue with 95th percentile traffic volumes. The HCM 6th Edition methodology worksheets report queues in number of vehicles per lane, however an average vehicle length of 25 feet was assumed for analysis purposes. The reported queues therefore represent the calculated maximum back of queue in feet per lane.
- [3] Represents the change in calculated maximum back of queue (in feet per lane) due to the addition of project-related traffic.

LEVEL OF SERVICE FOR SIGNALIZED INTERSECTIONS

In the *Highway Capacity Manual (HCM)*, published by the Transportation Research Board, level of service for signalized intersections is defined in terms of delay, which is a measure of driver discomfort, frustration, fuel consumption, and increased travel time. The delay experienced by a motorist is made up of a number of factors that relate to control, geometrics, traffic, and incidents. Total delay is the difference between the travel time actually experienced and the reference travel time that would result during base conditions: in the absence of traffic control, in the absence of geometric delay, in the absence of incidents, and when there are no other vehicles on the road. Only the portion of total delay attributed to the control facility is quantified. This delay is called *control delay*. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay.

Level of Service criteria for traffic signals are stated in terms of the average control delay per vehicle. Delay is a complex measure and is dependent on a number of variables, including the quality of progression, the cycle length, the green ratio, and the v/c ratio for the lane group in question.

Level of Service Criteria for Signalized Intersections	
Level of Service	Control Delay (Sec/Veh)
A	≤ 10
B	$> 10 \text{ and } \leq 20$
C	$> 20 \text{ and } \leq 35$
D	$> 35 \text{ and } \leq 55$
E	$> 55 \text{ and } \leq 80$
F	> 80

Level of Service (LOS) values are used to describe intersection operations with service levels varying from LOS A (free flow) to LOS F (jammed condition). The following descriptions summarize *HCM* criteria for each level of service:

LOS A describes operations with very low control delay, up to 10 seconds per vehicle. This level of service occurs when progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay values.

LOS B describes operations with control delay greater than 10 and up to 20 seconds per vehicle. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of delay.

LOS C describes operations with control delay greater than 20 and up to 35 seconds per vehicle. These higher delays may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.

LOS D describes operations with control delay greater than 35 and up to 55 seconds per vehicle. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high v/c ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.

LOS E describes operations with control delay greater than 55 and up to 80 seconds per vehicle. This level is considered by many agencies to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are frequent occurrences.

LOS F describes operations with control delay in excess of 80 seconds per vehicle. This level, considered to be unacceptable to most drivers, often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the lane groups. It may also occur at high v/c ratios with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing factors to such delay levels.

LEVEL OF SERVICE FOR UNSIGNALIZED INTERSECTIONS

In the *Highway Capacity Manual (HCM)*, published by the Transportation Research Board, 2000, level of service for unsignalized intersections is defined in terms of delay, which is a measure of driver discomfort, frustration, fuel consumption, and lost travel time. The delay experienced by a motorist is made up of a number of factors that relate to control, geometrics, traffic, and incidents. Total delay is the difference between the travel time actually experienced and the reference travel time that would result during base conditions, in the absence of incidents, control, traffic, or geometric delay. Only the portion of total delay attributed to the traffic control measures, either traffic signals or stop signs, is quantified. This delay is called *control delay*. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay.

Level of Service criteria for unsignalized intersections are stated in terms of the average control delay per vehicle. The level of service is determined by the computed or measured control delay and is defined for each minor movement. Average control delay for any particular minor movement is a function of the service time for the approach and the degree of utilization. (Level of service is not defined for the intersection as a whole for two-way stop controlled intersections.)

Level of Service Criteria for TWSC/AWSC Intersections	
Level of Service	Average Control Delay (Sec/Veh)
A	≤ 10
B	$> 10 \text{ and } \leq 15$
C	$> 15 \text{ and } \leq 25$
D	$> 25 \text{ and } \leq 35$
E	$> 35 \text{ and } \leq 50$
F	> 50

Level of Service (LOS) values are used to describe intersection operations with service levels varying from LOS A (free flow) to LOS F (jammed condition). The following descriptions summarize *HCM* criteria for each level of service:

LOS A describes operations with very low control delay, up to 10 seconds per vehicle.

LOS B describes operations with control delay greater than 10 and up to 15 seconds per vehicle.

LOS C describes operations with control delay greater than 15 and up to 25 seconds per vehicle.

LOS D describes operations with control delay greater than 25 and up to 35 seconds per vehicle.

LOS E describes operations with control delay greater than 35 and up to 50 seconds per vehicle.

LOS F describes operations with control delay in excess of 50 seconds per vehicle. For two-way stop controlled intersections, LOS F exists when there are insufficient gaps of suitable size to allow side-street demand to safely cross through a major-street traffic stream. This level of service is generally evident from extremely long control delays experienced by side-street traffic and by queuing on the minor-street approaches.
