What Is Adderall?

Adderall is a combination medication made from **amphetamine and dextroamphetamine**, two central nervous system stimulants that improve focus, attention, and impulse control.

Doctors prescribe Adderall primarily for:

- **Attention Deficit Hyperactivity Disorder (ADHD)**
- **Narcolepsy (sudden daytime sleepiness)**

By increasing the levels of dopamine and norepinephrine in the brain, Adderall helps boost concentration, energy, and alertness.

It is available in both:

- **Immediate-release tablets (IR)** — Fast-acting relief, perfect for short-term focus.
 - **Extended-release capsules (XR)** — Long-lasting control for all-day performance.
